BłÁȼkRøđ:

This is one of the very most advanced weapons ever built for nonlethal self-defense. To build it you have to take a cotton handle, fill it inside with hot glue, and a screw long enough on the inside, the screw must be penetrated by the glue casting to anchor it well to the mechanism. Build a hole with a drill to pass the hook or wire through to attach it to a key ring thus also adapting it to an anti-disarming system. The handle is wrapped with one layer of Styrofoam, another of inner tubes and two layers of double non-slip mats. This system is used to cushion the handle to the maximum spring mode. with material composed of 80 percent air the top part must be fused with hot glue to allow the thumb to be firmly attached. The bottom part, on the other hand, consists of 4 more nails installed with a blowtorch at the base to melt the installed material. The handle material is tightly tightened with spring-loaded pigtails. The size of the weapon is made on purpose to fit in a pocket and be concealed to perfection, but the structure is made on purpose to be both small, but at the same time extremely powerful and efficient in addition to being incapacitating almost instantaneously given the structure of the central screw wrapped by a helical spun iron, the 4 nails come as a support to cause further pain and to penetrate thick clothes without too much hindrance, the sudden brake transmits the kinetic energy all within the body to projectile ways.
